MARSHALL MULTISPREAD 950TM 980TM 910TM

DISCLAIMER

IMPORTANT, READ THIS BEFORE USING THE MARSHALL MULTISPREAD

The Marshall Multispread is to be used in the Agricultural and Horticultural industries to apply granulated and non-granulated fertilisers. It is very important that you follow the Calibration procedures and Operating instructions before using the Marshall Multispread. Calibration and operation of the Marshall Multispread must be in accordance with these instructions. Use of the Marshall Multispread is subject to the following disclaimer;

1. So far as is legally permissible Roesner, or its distributors, shall not be liable, whatever the cause, for any increased costs, loss of profits, business, contracts, income, or anticipated savings or for any special, indirect or inconsequential damage.
2. The capabilities and functions of the Marshall Multispread are limited as set out in the specifications in this manual.
3. Without prejudice to the above it is hereby acknowledged that the Marshall Multispread is not designed nor intended to achieve application rates and spread widths outside the parameters published in this manual.

1. Overview

This Manual

This manual explains the everyday use of the machine to the operator, including Spinner Setup and Application Rate Charts.

Application

The Marshall Multispread 950TM, 980TM and 910TM Fertiliser Spreader will spread a wide range of granular and non-granular fertilisers, from lime, gypsum and manures through to granulated materials like superphosphate, urea and various seeds.

The machine is fitted with a Ground Driven Feed System. The feed of fertiliser to the spinners, is driven by the jockey wheel which runs on the truck tyre. Application rates are varied by changing the hopper door opening, the width of pass or the drive sprocket settings. The twin 700mm spinners are driven from a 25HP spreader engine or optional hydraulic spinner drive.

2. Caution - For Your Safety

READ BEFORE USING THE SPREADER

Turn off the spreader engine when making adjustments to the v-belts, drive sprockets and feed door or when carrying out normal maintenance.

After servicing the gearbox, final drive sprockets and drive belts ensure that the plastic guards are re-fitted to the spreader.

Do not stand or work near the spinners while they are rotating. Do not operate the spreader within 50m of stock, property or personnel. Failure to do so can result in damage and injury.

Please take notice of following information. Safety stickers are located on your machine for further reference.

Forward speed is not to exceed 80km/h when machine unloaded and 25km/h when loaded with product. Excess speed will increase the chances of rollovers and also effect the accuracy of the spread pattern due to a slipstream effect behind the machine.

It is not recommended to operate on inclines greater than 20 degrees, as the chances of rollover are greatly increased.

Do not ride on Spreader under any circumstances.

Stay well clear of the hydraulic hoses and pipes that run the spinner and feed belt systems.

The machine is fitted with safety stickers, do not remove under any circumstances.

MARSHALL MULTISPREAD 950TM 980TM 910TM

3. *Operating Instructions*

3.1 *Engine Spinner Drive*

Standard 900 Series Truck mounted machines are fitted with an electric start petrol engine to drive the spinners.

The engine is located at the front of the spreader as shown in Fig 1 below. A 12V battery is fitted at the front of the spreader chassis, with a 25L fuel tank located on the passenger side.

The 25Hp engine Vee Belt drive is configured according to the chart below.

Fig 1

Spinner Diameter	Pulley Engine Output	Pulley Side Shaft	Engine RPM	Spinner RPM
600mm	4.5" x 2B	15 x 2B	2500	900
700mm	4.5" x 2B	15 x 2B	2220	800

3.2 *Hydraulic Spinner Drive (Optional)*

Machines that are fitted with an optional hydraulic spinner drive require an oil flow from the truck according to the chart below.

To set the correct spinner speed follow this procedure:

1. Connect the two hoses to the truck pump - the pressure hose is the one marked IN on the spreader flow control valve.
2. Run the truck until the oil has reached operating temperature and then increase the truck engine to full throttle and adjust the spreader flow valve so that the spinners are running at the desired RPM, see the chart above. To adjust the spinner speed use the flow control valve (FCV) on the control valve block. See Fig 2 opposite.
3. When the spinners are running at the desired RPM with the truck at full throttle, the truck engine speed should be lowered to where the spinners drop below 700RPM. (At this point make note of this lower truck engine speed, as you can work from this engine speed up to full throttle without alerting the spinners RPM.

Spinner Diameter	Oil Flow (L/min)
600mm	45
700mm	60

Fig 2

Fig 3

3.3 *Application Rates*

Application Rates are altered by changing the speed of the feed belt and feed door opening. The feed belt speed is altered by using different drive sprocket combinations located on the final drive. (see Section 6 of this manual)

The feed door opening is adjusted by the feed door shaft located at the rear of the machine and is held in place by the feed door adjuster disc and spring loaded pin. (See Figure 3)

Refer to the charts in Section 8 of this manual for correct drive sprocket and feed door settings for different fertiliser types.

The outer holes on the disc equate to 5mm of feed door movement. The inner set of holes are used for fine adjustment in application rate and equate to 2.5mm of feed door movement.

3.4 *Width of Pass*

The Width of Pass is the distance between the centres of each run or pass in the paddock. Some initial testing is required to determine the correct width of pass for a particular material being spread. You should allow for wind conditions and fertiliser consistency.

There are three different spinner vane configurations fitted to Marshall Multispread 900 Series machines. The spinner vane design determines the width and accuracy of the machines spread pattern. Refer to Section 5 of this manual for details on the vane configuration.

It is strongly advised, for all granulated and non-granulated products, that a trial run or test is done to determine the best and most even spread width between passes, as wind conditions and product consistency may vary.

!! CHECK SPINNER VANE CONFIGURATION BEFORE STARTING WORK !!

3.5 *Starting and Stopping Work*

To start work in the paddock :

1. Ensure that the spreader is at least 50m from stock, personnel and property.
2. Start the spreader engine, allow the engine to idle for a few minutes to reach operating temperature. Then increase the engine RPM to between 2300-2700 RPM.
3. Engage the engine jockey arm using the manual lever or using the optional compressed air cylinder.
4. Engage the wheel drive arm using the manual lever or via the optional compressed air cylinder switch located in the truck cabin.

****It is recommended that the wheel drive arm is engaged whilst the machine is stationary. Engaging the wheel drive arm at speeds greater than 10km/h will lead to premature wear and subsequent failure of the jockey wheel gearbox.**

5. Begin Work.

To finish work in the paddock :

1. Stop the truck.
2. Disengage the Engine drive using the manual lever or optional compressed air cylinder.
3. Disengage the Wheel drive arm using the manual lever or optional compressed air cylinder

(NB : In all circumstances when the spreader is not in work ensure that the wheel drive arm is lifted off the truck tyre. When driving on roads for extended periods it is recommended that the wheel drive arm is fastened to the hopper using a chain and "D" shackles.)

MARSHALL MULTISPREAD 950TM 980TM 910TM

4. Maintenance

4.1 Bearings

The machine is fitted with sealed self aligning bearings, however due to the abrasive nature of fertilisers, grease must be applied regularly. There are a series of yellow stickers fixed to the machine that indicate the location of grease points and greasing intervals. It is important that the top and bottom spinner bearings must be greased once every four hours of operation.

4.2 Drive Chains

The Machine is fitted with roller chain drives on the wheel drive arm and feedbelt final drive. The specifications of these chains are :

Location	Type	Qty
Wheel Drive	60-H Roller Chain - 3/4" pitch	5 ft
Final Drive	80-H Roller Chain - 1" pitch	5 ft

4.3 Cleaning and Storage

After using the spreader all fertiliser should be removed from the hopper and spinner areas. Wash down the machine with a high pressure water hose.

DO NOT USE OIL OR DIESEL NEAR THE PVC FEED BELT.

Always store the machine under cover and in a dry place. The PVC feed belt should not be exposed to prolonged periods on sunlight.

4.4 Gearbox Maintenance

The gearbox oil used on all 20:1 ratio gearboxes is : 85W140. The gearbox capacity is located at the rear of the machine. Please check oil regularly, the chart below indicates filling capacity :

Please Note : All Gearboxes are labelled and have ID Plates.

Gearbox	Capacity	Output Shaft Size
Leroy Somer	1000 mL	28mm / 8mm Key
Fenner "D"	1500 mL	25mm / 8mm Key
Fenner "C"	1000 mL	22mm / 6mm Key
Rossi	1000 mL	24mm / 8mm Key

MARSHALL MULTISPREAD 950TM 980TM 910TM

4.5 *Recommended Drive Tyre Pressure*

CHECK TYRE PRESSURE REGULARLY

It is important that the ground drive wheel is inflated to the correct pressure as incorrect inflation can cause issues with the feed belt mechanism.

Tyre Size	Pressure (psi)	Pressure (bar)
Wheel Drive Tyres		
145x10 (800 Series)	22	1.5
185/70 x 13 (900 Series)	22	1.5

4.6 *Engine Drive*

Ensure that the engine is serviced regularly based on the requirements setout in the service manual that is provided with the spreader.

Check the 12V battery, fuel tank and fuel line regularly to ensure correct operation.

MARSHALL MULTISPREAD 950TM 980TM 910TM

4.7 CC180 Spinner Drive Belt - Engine Spinner Drive Only

CHECK FOR CORRECT V-BELT ALIGNMENT AND TENSION

The V-Belt should clear the left hand spinner pulley by approx 3 to 4mm (Fig 4) - adjust this by moving the side shaft pulley on the side shaft.

The tension pulley should just clear the V-Belt by about 2mm near the right hand spinner pulley (Fig 5 - adjust the angle at the tension pulley mount (Fig 6).

For the correct V-Belt tension see figure (7), once tension has been taken up there should be approximately 40mm from the top of the V-Belt to the top of the side shaft as shown. (Fig 7). To adjust tension loosen off the tension pulley shaft nut (Fig 3) then tension the adjuster (Fig 8).

Important Note: ENGAGING SPINNER DRIVE.

Before engaging the Engine or Hydraulic Drive, the truck engine should be idling at the lowest possible engine speed. Engage the spinner drive and then bring the truck engine up to normal working RPM.

Fig 3 & 4

Fig 7

Fig 5 and 6

Fig 8

4.8 Endless Belt System

The machine is fitted with a high quality PVC Endless Belt. This belt should be kept out of excess sunlight and away from oil and diesel. The tension of the belt is adjusted by the front take up bearings. The belt is pre-tensioned and the tracking set in the factory. The tracking rollers Fig (10) located on the underside of the chassis help the belt to track correctly. The belt may move slightly in the first few days of operation as the belt is worn in.

The correct belt tension is 3% of the overall belt length. It is important that the take up bearings are only adjusted 1/4 of a turn at a time. Too much tension on the belt will be detrimental to the belt tracking, see Fig 11.

5. *Spinner Vane Setup*

5.1 *Multispread Spreading Performance*

There are many variables that affect the spreading performance of the Marshall Multispread. These variables include;

1. **Wind Speed and Direction.** Winds above 10 km/h influence the evenness of the spread pattern. In windy conditions it is recommended that the tractor/spreader is driven into the wind.
2. **Ground Speed.** In all cases ground speed should not exceed 25 km/h.
3. **Ground Contour.** The particles being spread up the slope will land at narrower widths and the width of pass should be reduced to compensate for this affect.
4. **In Crop Applications / Spreading in Stubble.** When spreading in standing crop or stubble the plants will dampen the flight and deflect the fertiliser to ground, narrowing the spread width.
5. **Component Wear.** Fertilisers can be abrasive which leads to component wear. It is recommended that the spinner discs and vanes are regularly checked for wear and replaced if necessary.
6. **Fertiliser Consistency.** Factors such as bulk density and particle size distribution influence the aerodynamic characteristics of the fertiliser particles. For example when spreading **Urea** it is recommended that the average particle size is greater than 3mm in diameter.

Before spreading it is recommended that a trial run is conducted on bare ground to visually inspect the evenness of the spread pattern.

For further information on spreader setup contact Roesner Pty Ltd support or your local Marshall Multispread dealer for more information.

5.2 *Type A Vanes and Fertiliser Deflector*

Older model Multispread were fitted with 6 mild steel angle spinner vanes on each spinner disc. These vanes can be used to spread granulated fertilisers up to 24 metres and non-granulated products up to 10 metres.

The spinner vanes can be adjusted to spread light applications of granulated fertilisers and seeds as well as heavy rates of non granulated materials such as lime, gypsum and manures.

Each vane is attached to the spinner disc by two bolts - an inner and an outer. The outer bolt can be varied to alter the angle of the spinner vanes. see fig 12 and 13 below.

For non granulated materials the fertiliser deflector chute should be removed to prevent clogging around the spinners.

Material	Outer Bolt Position	Fertiliser Deflector Chute Fitted
Granulated Fertilisers, Grain and Seeds	A	YES
Light to Medium Applications of Non-Granulated Product - Lime/Gypsum/Manures	A	NO
Heavy Applications of Non-Granulated Product - Lime/Gypsum/Manures	B	NO

Fig 12

Fig 13

MARSHALL MULTISPREAD 950TM 980TM 910TM

5.3 *Type B Vanes and Fertiliser Deflector*

900 Series Multispreads from 2006 production are fitted with three spinner vanes, pressed in a “C” channel and manufactured from 5mm Mild Steel. A simplified fertiliser deflector is also fitted.

The pressed “C” channel vanes can be used to spread granulated fertiliser up to 28 metres and non granulated products up to 12m.

The pitch or angle of each spinner vane can be altered to suit different types of fertiliser application rates. However a general setting to suit granulated fertilisers and non-granulated products is to have three vanes on each spinner on three different angles. This is done by setting each vane on different outer holes on the spinner disc - see Fig 14 below.

The Fertiliser Deflector should be fitted for both granulated and non-granulated products.

Fig 14

Vane Position	Outer Bolt Position
Position A	Centre Hole
Position B	Clockwise Hole
Position C	Counter Clockwise Hole

Fertiliser Deflector Chute

MARSHALL MULTISPREAD 950TM 980TM 910TM

5.4 *Type C Vanes and Fertiliser Deflector*

900 Series Multispreads from 2009 production were fitted with two 700mm diameter spinners, with convex centre dish. Six spinner vanes, pressed in a “C” channel and manufactured from 5mm mild steel are fitted to each spinner. see Fig 15 below.

All granulated Fertilizers, Seed and Dry Lime

For the best spread widths and uniformity it is recommended that the Fertilizer Deflector Chute be fitted and each spinner vane be bolted to the disc in the middle outer hole.

Spinner Speed - 800 RPM

Spread widths between passes

Seed - the spread width will depend on the size of seed.

Urea (approx 750kg/m³) 22m to 28m

Compound Fertilizers (approx 950kg/m³) 24m to 28m

Superphosphate (approx 1150kg/m³) 26m to 32m

Dry Lime (approx 1000kg/m³) 10m to 12m

Non Granulated Products - Lime, Gypsum and Manures

To spread these non-granulated products that may be lumpy and damp and are generally applied at higher rates, it is recommended that the Fertilizer Deflector Chute is removed leaving only the fixed divider above the spinners. Each spinner vane is to be bolted to the disc in the middle outer hole.

Spinner Speed 700 to 800 RPM

Spread widths between passes

Non-granulated products - 6m to 12m

For further information on the fertiliser chute position see the drawing on the following page.

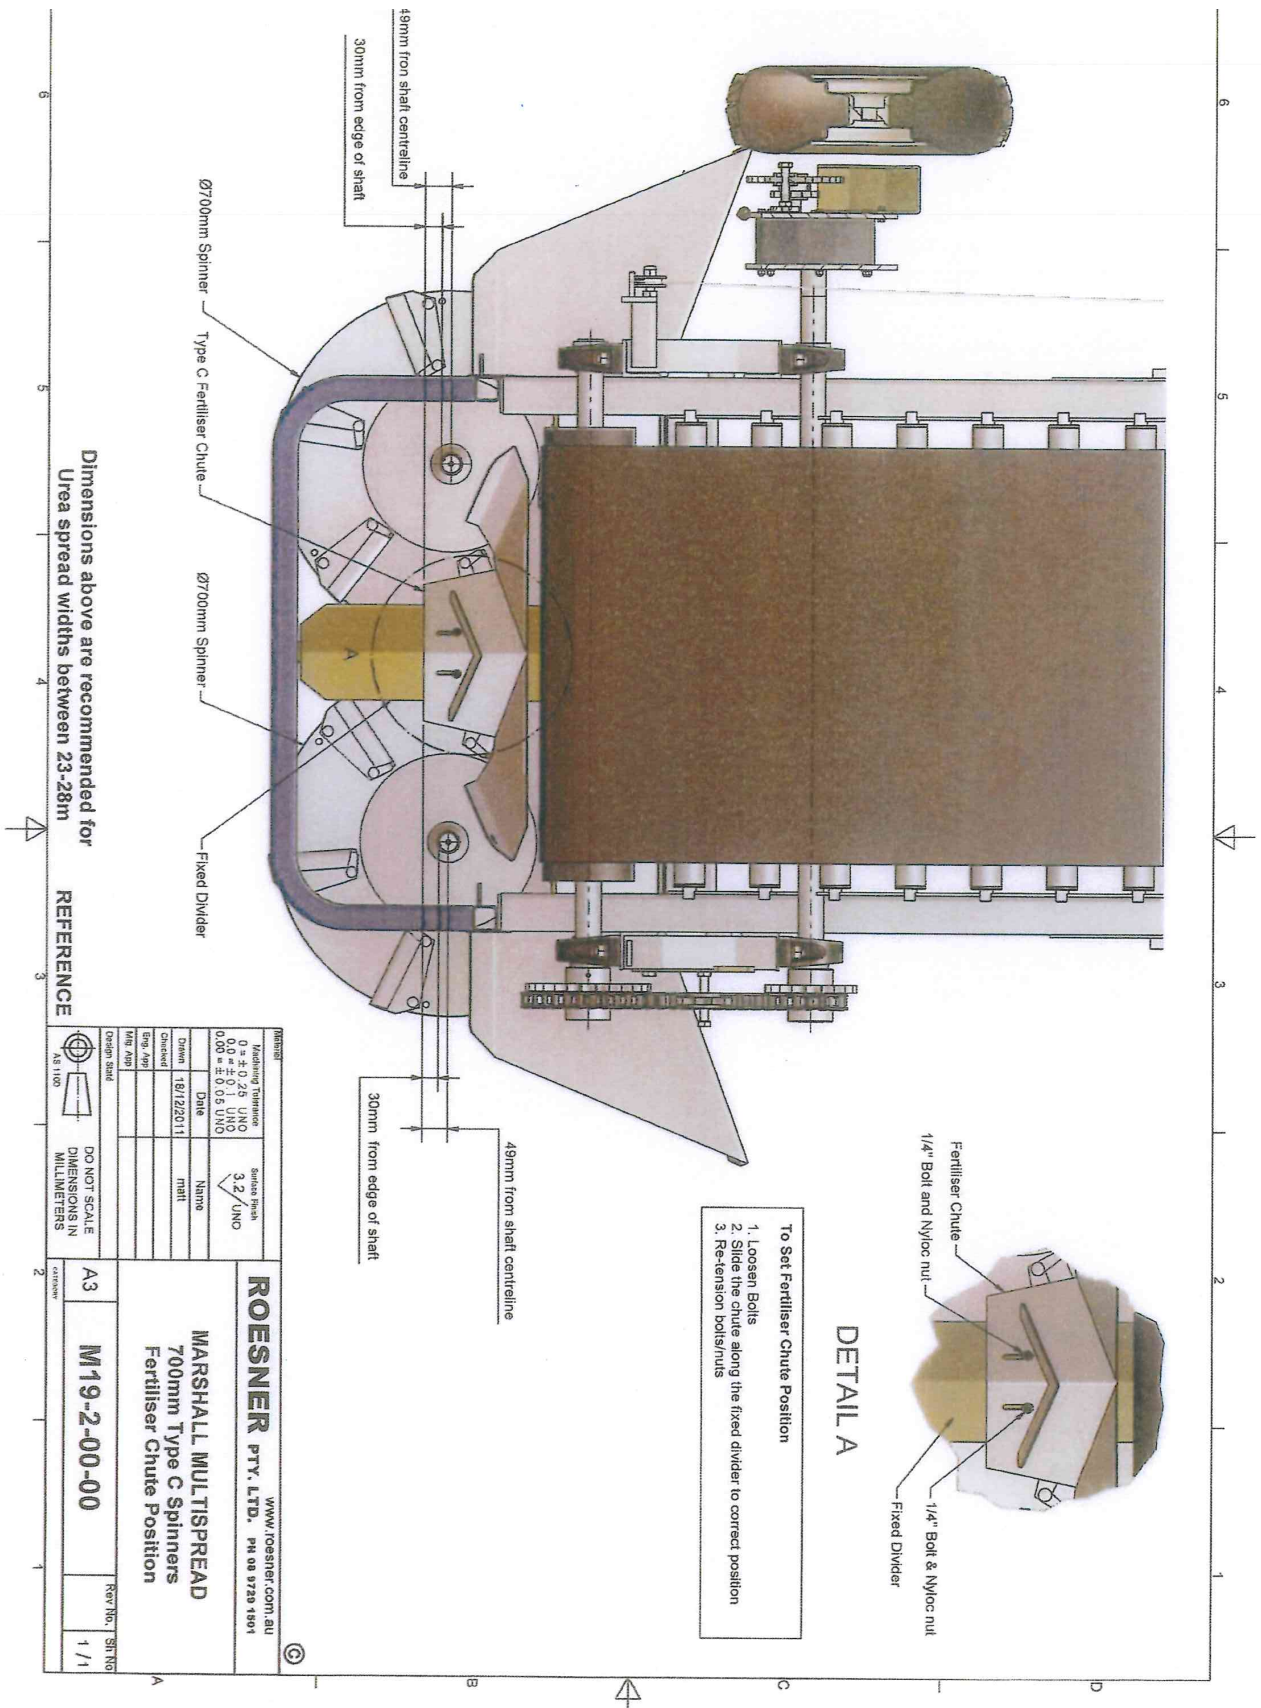

Fig 15

MARSHALL MULTISPREAD 950TM 980TM 910TM

5.5 *Type D/D2Spinner, Vanes and Fertiliser Deflector*

Multispreads from 2012 production are fitted with two 600mm diameter spinners. There are two long vanes and two short vanes fitted to the spinner discs. The long vanes have an effective diameter of 700mm and are normally in the radial position on the disc. The short vanes have an effective diameter of 600mm, their angular position is adjusted to the spreading width of different materials.

A two part fertiliser chute consisting of a top deflector assembly and lower baffle plate is used to guide fertiliser and screened product onto the spinners.

For lumpy non granulated product the fertiliser chute may have to be removed.

In 2016 the Type D2 vane, spinner and chute upgrade was launched. The Type D2 configuration should be fitted when spreading Urea and other non-granulated fertilisers. For more information on the Type D/D2 vane configuration see Type D/D2 Spinner Supplement at the back of this manual.

Type D configuration (left), Type D2 configuration (right)

6. *Drive Sprocket Settings*

The machine is fitted with four sets of feedbelt drive sprockets, two on each side of the machine, see fig 16 and 17 below. These sprockets are used to alter the feedbelt gearing to suit the different rates and types of fertilisers. A common drive chain runs between the sprocket sets. Release the spring loaded jockey to move the chain position.

!! REPLACE FINAL DRIVE GUARD AFTER ALTERING FINAL DRIVE RATIO !!

7. *Application Rate Calculations*

Application rates contained in this book are to be used as a guide only. The following can be used if you wish to check the application rate of the particular material that you are spreading.

1. Check the width of pass for the most even spread of material you will be using.
Spreading Width Guide:
Urea 16 - 28m
Superphosphate 16 - 30m
Lime and Gypsum 6 - 12m
2. Obtain the circumference of the wheel drive tyre.
Circumference = diameter x 3.141
example: jockey tyre diameter = 0.47m
Circumference = 0.47×3.141
= 1.476m
3. Put a small quantity of the material to be spread in the hopper and ensure that the material is packed evenly around the feed door opening.
4. Rotate the wheel drive tyre until the material is falling evenly off the feedbelt.
Note: The material must be falling evenly off the feedbelt to give an accurate reading.
5. Place a cardboard box or tarpaulin under the spinners to catch the material off the feedbelt.
6. Rotate the wheel drive wheel 10 times and then weigh the material caught off the feedbelt.
7. Multiply the distance travelled in the 10 turns of the wheel drive tyre by the width of pass.
example: $1.476 \times 10 = 14.76$ metres.
Width of pass = 16m
Then multiply $16 \times 14.76 = 236.128\text{m}^2$
8. Divide the weight of the material collected by the square metres of spread over 10 turns of the wheel drive.
example : 2.5kg of material divided by 236.128 = 0.0106
 0.0106×10000 to convert to kg/ha.
= 106 kg/ha.

To vary spread rates make adjustments to the drive sprocket settings and the opening of the feed door.

MARSHALL MULTISPREAD 950TM 980TM 910TM

8. Application Rate Charts

8.1 Type Of Material - Lime, Gypsum and Manure - 1000kg/m³

Due to the variation of weight per cubic metre between the different types of materials the chart below is intended as a guide only.

1. Changing the drive sprocket settings.
2. Adjusting the feed door openings.
3. Varying the width of pass. (The closer the pass the heavier the applications.)

All values are measured in kg/ha. To convert to lb/acre deduct 10% from each value.

8.4 Type Of Material - Granular Urea - 750 kg/m³

Due to the variation of weight per cubic metre between the different types of materials the chart below is intended as a guide only.

1. Changing the drive sprocket settings.
2. Adjusting the feed door openings.
3. Varying the width of pass. (The closer the pass the heavier the applications.)

All values are measured in kg/ha. To convert to lb/acre deduct 10% from each value.

MARSHALL MULTISPREAD 950TM 980TM 910TM

Marshall Multispread – Type D/D2 Spinner Vane Setup Supplement

Lime, Gypsum and Non-Granulated Fertilisers

When spreading lime, gypsum, dolomite, manure, mulch and sulphate of ammonia, two Type D short and two Type D long vanes should be fitted to each spinner. The short chute baffle should also be fitted.

The Type D vanes are shown fitted to the spinner above. Overall dimensions of the Type D vanes and short baffle are shown below.

MARSHALL MULTISPREAD 950TM 980TM 910TM

Marshall Multispread – Type D/D2 Spinner Vane Setup Supplement

Lime, Gypsum and Non-Granulated Fertilisers – Chute Setup

Feedbelt

→
Bolt in rear hole
(toward back of
spreader)

Fertiliser chute should be installed on fixed divider plate with the small baffle bolted on the underside of the fertiliser chute as shown. (M6 x 25mm bolt/nyloc nut)

The fertiliser chute should be set as close to the feedbelt as possible in the rear hole in the chute. Move the chute by undoing the central bolts and sliding the chute on the fixed divider.

Lime, Gypsum and Non-Granulated Fertilisers – Vane Setup

Long Vane on LH Spinner

Long Vane on RH Spinner

Short Vane on RH Spinner

Lime, Gypsum and Non-Granulated Fertilisers – Factors that affect Spread Pattern

It is important that the following variables are well understood prior to fertiliser application. Operational adjustments maybe required to maintain an even spread pattern to optimise fertiliser placement. Agronomic factors such as soil type, background soil nutrient levels and seasonal conditions should also be considered prior to spreading and setting application rates. Regular soil sampling is essential to understanding crop nutrient requirements. **Before starting work it is recommended that a short trial run over bare ground is undertaken to visually inspect the spread pattern. Width of pass should be adjusted in order to maintain an even spread pattern.**

1. Spinner Speed

Nominal Spinner speed for spreading Lime, Gypsum, Manure and SOA is 900 RPM. For finer materials reducing the spinner speed to 700 RPM may improve the spread pattern as less material sucked in behind the spreader by the air flow caused by the rotation disc. When spreading, monitor the spinner speed using the tachometer provided with the spreader.

2. Wind Speed and Direction

Fertiliser particles have relatively small diameters and masses, and as such their ballistic trajectories are influenced by wind speed and direction. Wind Conditions must be taken into account when choosing the width of pass in the paddock. It is recommended that spreading is carried out in still conditions with wind speeds no greater than 10 km/h. When spreading in a cross wind, the width of pass should be reduced to maintain a consistent overlap and ensure the accuracy of the spread distribution. Spreading with the wind may increase the spread width however the accuracy of the spread pattern maybe compromised. Spreading into the wind will ensure an even distribution but the overall width maybe reduced.

3. Fertiliser Consistency

Fertiliser properties such as particle size distribution and bulk density will vary depending on where the product is sourced from and environmental factors such as humidity and moisture content. Finer particles have smaller masses and as such they don't spread as far as larger heavier particles. It is important to consider particle size and bulk density prior to selecting the spread width in the field.

4. Component Wear

Worn spinner vanes and discs compromise the performance of the spreader. It is recommended that the vanes are kept clean and checked for wear on a regular basis. Vanes should be replaced if wear is visible.

5. Field Conditions

Spreading in stubble and on slopes will reduce the effective spread width of the spreader.

MARSHALL MULTISPREAD 950TM 980TM 910TM

Marshall Multisread – Type D/D2 Spinner Vane Setup Supplement

Urea, Superphosphate and other Granular Fertilisers

When spreading Urea, Superphosphate and other granulated fertilisers two Type D2 short and two Type D2 long vanes should be fitted to each spinner. The large chute baffle should also be fitted.

The Type D2 vanes are shown fitted to the spinner above. Overall dimensions of the Type D2 vanes and long baffle are shown below.

Urea, Superphosphate and other Granular Fertilisers - Chute Setup

Fertiliser chute should be installed on fixed divider plate with the large baffle bolted on the underside of the fertiliser chute. (M6 x 25mm bolt/nyloc nut)

The fertiliser chute should be set away from feedbelt as possible in the front hole in the chute. Move the chute by undoing the central bolts and sliding the chute on the fixed divider.

MARSHALL MULTISPREAD 950TM 980TM 910TM

Marshall Multispread – Type D/D2 Spinner Vane Setup Supplement

Type D/D2 Chute Reference Dimensions

To check the chute position relative to the spinner shafts :

- Place straight edge between spinner shafts
- Measure from the inside edge of the straight edge to the end of the chute as shown

187mm : Lime, Gypsum and Non-Granulated Fertilisers
197mm : Urea and Granulated Fertilisers
